

Chapter 10: DHCP

Routing & Switching

Cisco Networking Academy® Mind Wide Open™

- 10.0 Introduction
- 10.1 Dynamic Host Configuration Protocol v4
- 10.2 Dynamic Host Configuration Protocol v6
- 10.3 Summary

Chapter 10: Objectives

- Describe the operation of DHCPv4 in a small-to-medium-sized business network.
- Configure a router as a DHCPv4 server.
- Configure a router as a DHCPv4 client.
- Troubleshoot a DHCP configuration for IPv4 in a switched network.
- Explain the operation of DHCPv6.
- Configure a stateless DHCPv6 for a small-to-medium-sized business.
- Configure a stateful DHCPv6 for a small-to-medium-sized business.
- Troubleshoot a DHCP configuration for IPv6 in a switched network.

10.1 Dynamic Host Configuration Protocol v4

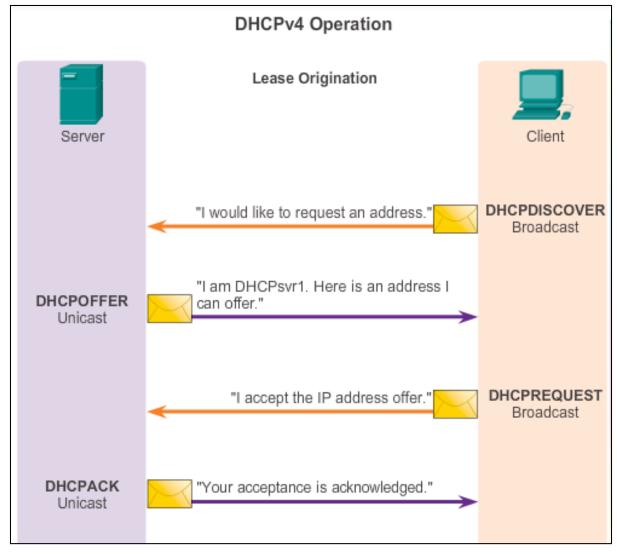

Cisco | Networking Academy® | Mind Wide Open™

DHCPv4 Operation Introducing DHCPv4

DHCPv4 uses three different address allocation methods:

- **Manual Allocation** The administrator assigns a pre-allocated IPv4 address to the client, and DHCPv4 communicates only the IPv4 address to the device.
- **Automatic Allocation** DHCPv4 automatically assigns a static IPv4 address permanently to a device, selecting it from a pool of available addresses.
- **Dynamic Allocation** DHCPv4 dynamically assigns, or leases, an IPv4 address from a pool of addresses for a limited period of time chosen by the server, or until the client no longer needs the address. This method is the most commonly used.

DHCPv4 Operation DHCPv4 Operation

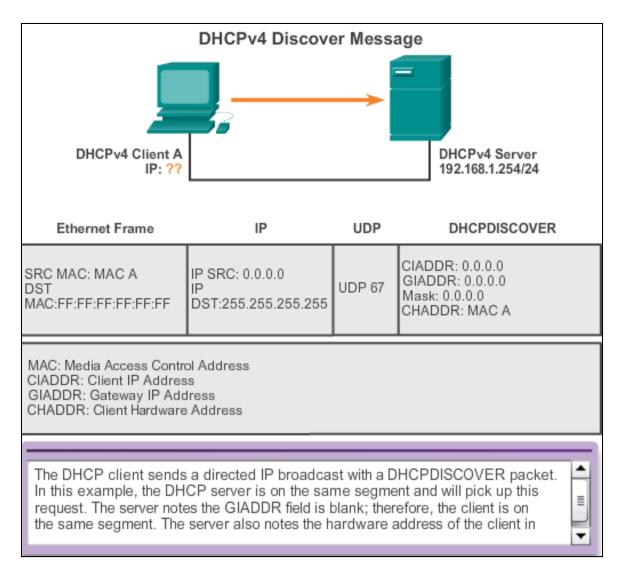

DHCPv4 Message Format

DHCPv4 Message Format				
8	16	24	32	
OP Code (1)	Hardware type (1)	Hardware address length (1)	Hops (1)	
Transaction Identifier				
Seconds - 2 bytes		Flags - 2 bytes		
Client IP Address (CIADDR) - 4 bytes				
Your IP Address (YIADDR) - 4 bytes				
Server IP Address (SIADDR) - 4 bytes				
Gateway IP Address (GIADDR) - 4 bytes				
Client Hardware Address (CHADDR) - 16 bytes				
Server name (SNAME) - 64 bytes				
Boot Filename - 128 bytes				
DHCP Options - variable				

DHCPv4 Operation

Format DHCPv4 Discover and Offer Messages

DHCPv4 Operation

Configuring a DHCPv4 Server

A Cisco router running the Cisco IOS software can be configured to act as a DHCPv4 server. To set up DHCP:

- 1. Exclude addresses from the pool.
- Set up the DHCP pool name.
- Define the range of addresses and subnet mask. Use the default-router command for the default gateway. Optional parameters that can be included in the pool – dns server, domain-name.

R1 (config) # ip dhcp excluded-address 192.168.10.1 192.168.10.9
R1 (config) # ip dhcp excluded-address 192.168.10.254
R1 (config) # ip dhcp pool LAN-POOL-1
R1 (dhcp-config) # network 192.168.10.0 255.255.255.0
R1 (dhcp-config) # default-router 192.168.10.1
R1 (dhcp-config) # dns-server 192.168.11.5
R1 (dhcp-config) # domain-name example.com
R1 (dhcp-config) # end

To disable DHCP, use the **no service dhcp** command.

R1#

Verifying a DHCPv4 Server

Commands to verify DHCP:

```
show running-config | section dhcp
show ip dhcp binding
show ip dhcp server statistics
```

On the PC, issue the ipconfig /all command.

```
_ 0
C:\WINDOWS\system32\cmd.exe
  WINS Proxy Enabled ..... No
Ethernet Adapter Local Area Connection
  Connection-specific DNS Suffix.: example.com
  Description ...... SiS 900 PCI Fast Ethernet

             . . . . . . . . .: 192.168.11.5
C:\Documents and settings\SpanPC>
```

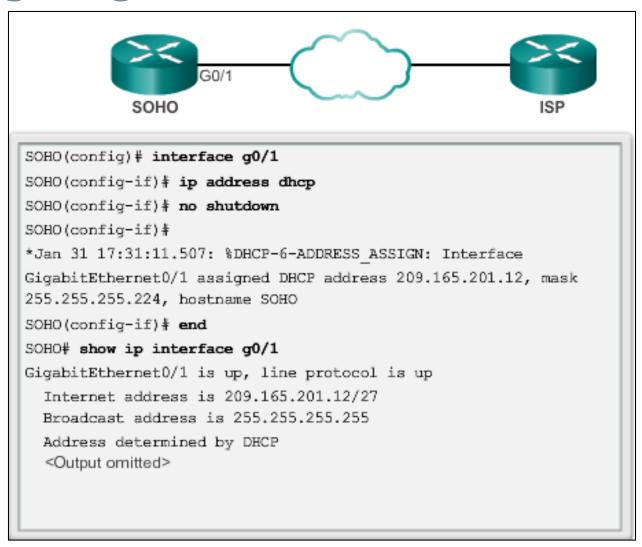

Using an IP helper address enables a router to forward DHCPv4 broadcasts to the DHCPv4 server. Acting as a relay.

```
R1(config) # interface g0/0
R1(config-if) # ip helper-address 192.168.11.6
R1(config-if) # end
R1# show ip interface g0/0
GigabitEthernet0/0 is up, line protocol is up
Internet address is 192.168.10.1/24
Broadcast address is 255.255.255
Address determined by setup command
MTU is 1500 bytes
Helper address is 192.168.11.6
<Output omitted>
```

Verifying the Router DHCPv4 Configuration

Verifying DHCPv4 Relay and DHCPv4 Services

```
R1# show running-config | section interface GigabitEthernetO/O
interface GigabitEthernetO/O
ip address 192.168.10.1 255.255.255.0
ip helper-address 192.168.11.6
duplex auto
speed auto
R1#
R1# show running-config | include no service dhcp
R1#
```

Verifying DHCPv4 Using Router debug Commands

```
R1(config) # access-list 100 permit udp any any eq 67
R1(config) # access-list 100 permit udp any any eq 68
R1(config) # end
R1# debug ip packet 100
IP packet debugging is on for access list 100
*IP: s=0.0.0.0 (GigabitEthernet0/1), d=255.255.255.255, len 333,
revd 2
*IP: s=0.0.0.0 (GigabitEthernet0/1), d=255.255.255.255, len 333,
stop process pak for forus packet
*IP: s=192.168.11.1 (local), d=255.255.255.255
(GigabitEthernet0/1), len 328, sending broad/multicast
<Output omitted>
Router1# debug ip dhcp server events
DHCPD: returned 192.168.10.11 to address pool LAN-POOL-1
DHCPD: assigned IP address 192.168.10.12 to client
0100.0103.85e9.87.
DHCPD: checking for expired leases.
DHCPD: the lease for address 192.168.10.10 has expired.
DHCPD: returned 192.168.10.10 to address pool LAN-POOL-1
```

10.2 Dynamic Host Configuration Protocol v6

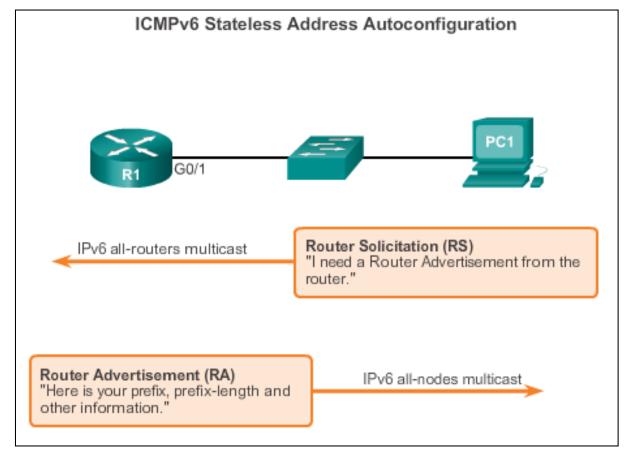

Cisco | Networking Academy® | Mind Wide Open™

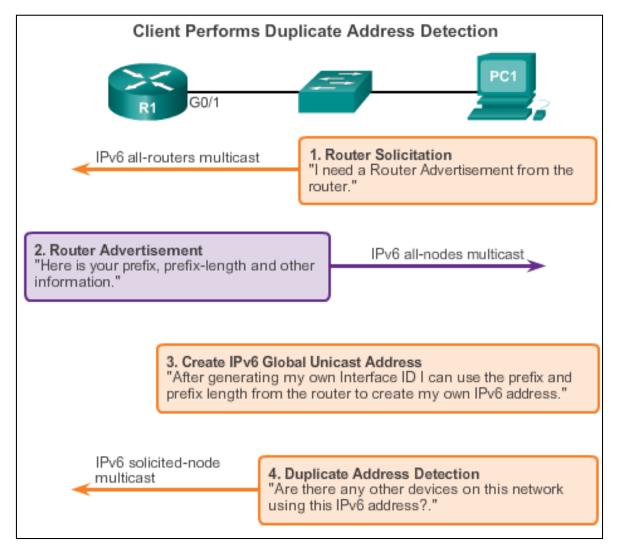

SLAAC and DHCPv6

Stateless Address Autoconfiguration

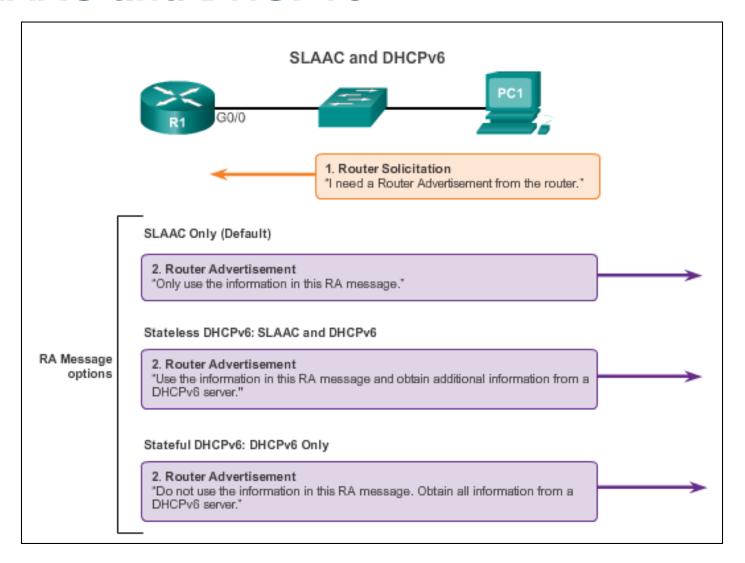

Stateless Address Autoconfiguration (SLAAC) is a method in which a device can obtain an IPv6 global unicast address without the services of a DHCPv6 server.

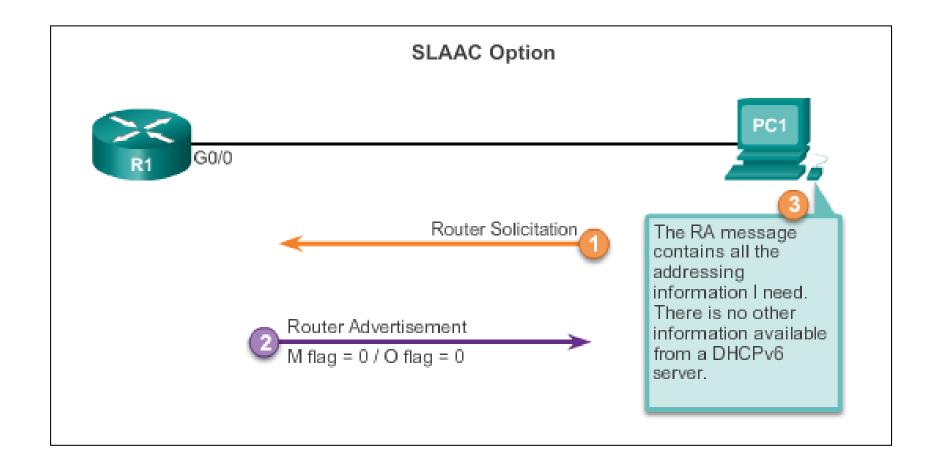

SLAAC and DHCPv6 SLAAC Operation

SLAAC and DHCPv6 SLAAC and DHCPv6

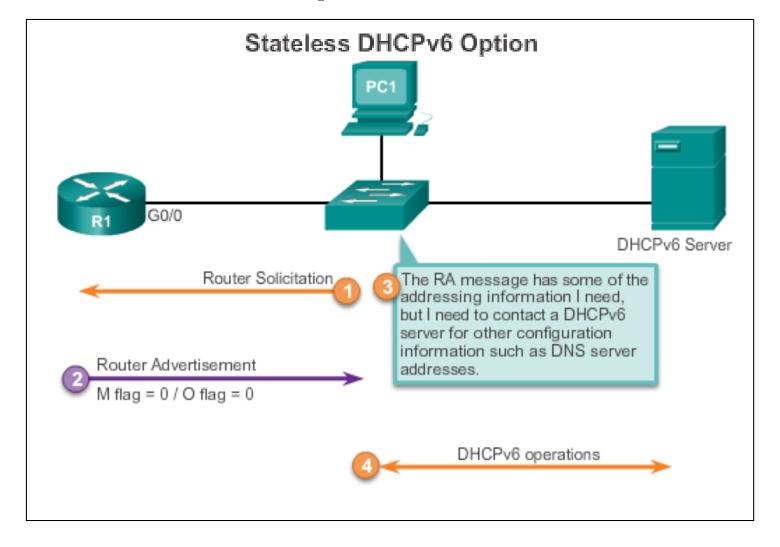

SLAAC and DHCPv6 SLAAC Option

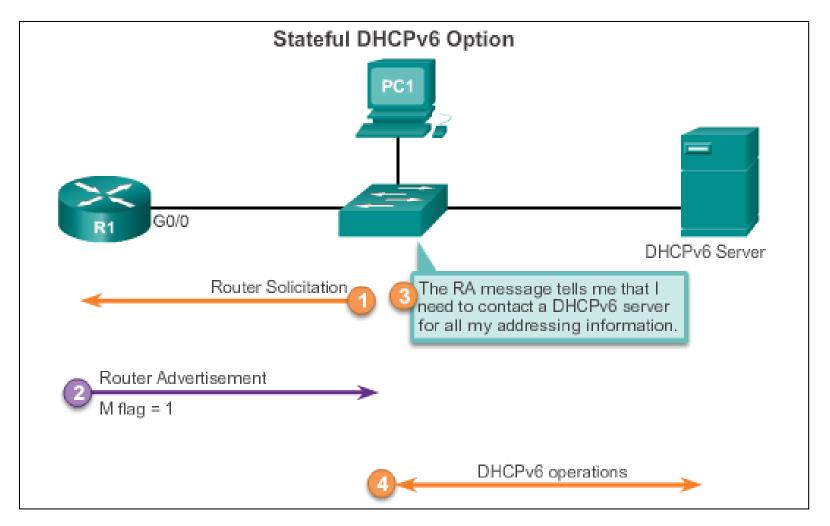

SLAAC and DHCPv6

Stateless DHCPv6

Verifying Stateless DHCPv6

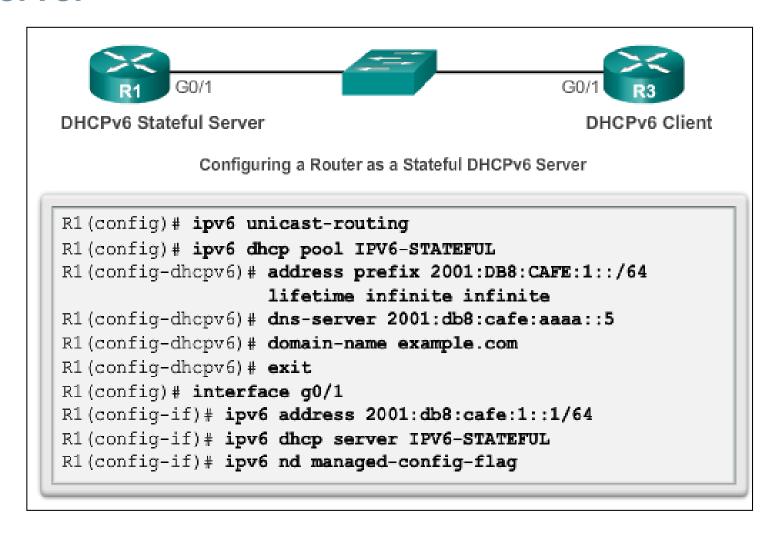

Verify the stateless DHCP client using the following commands:

- show IPv6 interface
- debug ipv6 dhcp detail

Stateful DHCPv6

Configuring a Router as a Stateful DHCPv6 Server

Verifying Stateful DHCPv6

Verify the stateful DHCPv6 server using the following commands:

```
show ipv6 dhcp pool show ipv6 dhcp binding
```

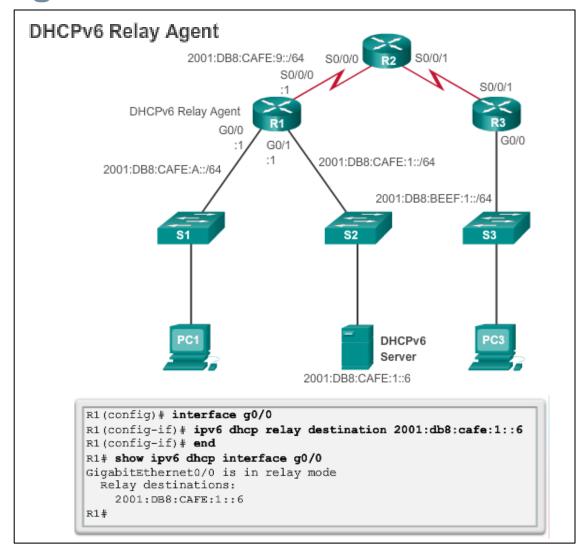

Verify the stateful DHCPv6 client using the show ipv6 interface command.

```
R3# show ipv6 interface g0/1
GigabitEthernet0/1 is up, line protocol is up
  IPv6 is enabled, link-local address is
FE80::32F7:DFF:FE25:2DE1
 No Virtual link-local address(es):
  Global unicast address(es):
    2001:DB8:CAFE:1:5844:47B2:2603:C171, subnet is
2001:DB8:CAFE:1:5844:47B2:2603:C171/128
  Joined group address(es):
   FF02::1
    FF02::1:FF03:C171
   FF02::1:FF25:2DE1
  MTU is 1500 bytes
  ICMP error messages limited to one every 100 milliseconds
  ICMP redirects are enabled
  ICMP unreachables are sent
  ND DAD is enabled, number of DAD attempts: 1
  ND reachable time is 30000 milliseconds (using 30000)
  ND NS retransmit interval is 1000 milliseconds
  Default router is FE80::D68C:B5FF:FECE:A0C1 on
```

Stateful DHCPv6

Configuring a Router as a Stateful DHCPv6 Relay Agent

Troubleshooting Task 1:	Resolve conflicts.
Troubleshooting Task 2:	Verify allocation method.
Troubleshooting Task 3:	Test with a static IPv6 address.
Troubleshooting Task 4:	Verify switch port configuration.
Troubleshooting Task 5:	Test from the same subnet or VLAN.

Troubleshooting DHCPv6 Verifying the Router DHCPv6 Configuration

```
R1(config) # ipv6 unicast-routing
R1(config) # ipv6 dhcp pool IPV6-STATEFUL
R1(config-dhcpv6) # address prefix 2001:DB8:CAFE:1::/64 lifetime
infinite infinite
R1(config-dhcpv6) # dns-server 2001:db8:cafe:aaaa::5
R1(config-dhcpv6) # domain-name example.com
R1(config-dhcpv6) # exit
R1(config-dhcpv6) # exit
R1(config-if) # ipv6 address 2001:db8:cafe:1::1/64
R1(config-if) # ipv6 dhcp server IPV6-STATEFUL
R1(config-if) # ipv6 nd managed-config-flag
```

Stateless DHCPv6 Services

```
R1(config) # ipv6 unicast-routing
R1(config) # ipv6 dhcp pool IPV6-STATELESS
R1(config-dhcpv6) # dns-server 2001:db8:cafe:aaaa::5
R1(config-dhcpv6) # domain-name example.com
R1(config-dhcpv6) # exit
R1(config-dhcpv6) # exit
R1(config) # interface g0/1
R1(config-if) # ipv6 address 2001:db8:cafe:1::1/64
R1(config-if) # ipv6 dhcp server IPV6-STATELESS
R1(config-if) # ipv6 nd other-config-flag
```

Troubleshooting DHCPv6 Debugging DHCPv6

```
R1# debug ipv6 dhcp detail
   IPv6 DHCP debugging is on (detailed)
R1#
*Feb 3 21:27:41.123: IPv6 DHCP: Received SOLICIT from
FE80::32F7:DFF:FE25:2DE1 on GigabitEthernet0/1
*Feb 3 21:27:41.123: IPv6 DHCP: detailed packet contents
*Feb 3 21:27:41.123: src FE80::32F7:DFF:FE25:2DE1

*Feb 3 21:27:41.127: IPv6 DHCP: Using interface pool IPv6-
STATEFILL
*Feb 3 21:27:41.127: IPv6 DHCP: Creating binding for
FE80::32F7:DFF:FE25:2DE1 in pool IPV6-STATEFUL
<Output omitted>
```

10.3 Summary

Cisco Networking Academy® Mind Wide Open™

- All nodes on a network require a unique IP address to communicate with other devices.
- DHCPv4 includes three different address allocation methods:

Manual Allocation

Automatic Allocation

Dynamic Allocation

There are two methods available for the dynamic configuration of IPv6 global unicast addresses:

Stateless Address Autoconfiguration (SLAAC)

Dynamic Host Configuration Protocol for IPv6 (Stateful DHCPv6)

Chapter 10: Summary (cont.)

The same tasks are involved when troubleshooting DHCPv4 and DHCPv6:

- Resolve address conflicts.
- Verify physical connectivity.
- Test connectivity using a static IP address.
- Verify the switch port configuration.
- Test the operation on the same subnet or VLAN.
